                                                                                                                                                                                                                                                                                                 Score:
                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel method for harvesting a (poly) peptide produced by a recombinant host cell. The novel method involves selecting a cell comprising a first nucleic acid encoding a leader peptide and a second nucleic acid fragment encoding the desired (poly) peptide. The first and second fragments are within the same open reading frame of the first nucleic acid and the leader peptide is functionally equivalent to an N-terminal leader peptide found with the pre-peptide of a lantibiotic. The host cells and nucleic acids are useful for producing, harvesting and post-translational modification of polypeptides. The polypeptides may be used in the production of pharmaccuticals, e.g. as antigen for vaccine or immunogenic composition. This sequence represents a polypeptide relating

                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes an isolated bacterial protein that CC induces fibrin-dependent plasminogen activation in a pharmaceutical CC composition for dissolving blood clots. Also described are: (1) a CC composition tomprising an isolated modified streptokinase, the CC modification being removal of amino acid residues in the amino terminus; (2) a method for dissolving a blood clot in a subject, comprising CC administering to the subject a fibrin-dependent streptokinase protein; a CC nucleic acid (1) encoding a modified bacterial streptokinase; (3) an CC expression vector of (3). The pharmaceutical composition comprising a compression vector of (3). The pharmaceutical composition comprising a blood clots in patients with a thrombotic condition, e.g. myocardial cC infarction, venous thrombosis, pulmonary embolism, cerebral thrombosis, CC graft thrombosis and arterial thrombosis. The modified streptokinase can CC also be used in non-human mammals. Streptokinase activation of plasminogen is at least 10-fold, preferably 100-fold greater in the cc presence of fibrin than in the absence of fibrin. The modified constrate site for proteolytic cleavage. This reduces the rate of CC degradation of the streptokinase at least two-fold. The present sequence CC represents native by field) protection of strandardise by field)
                                                                                                                                                                                                                                                                                                                                                                                     Sequence 414.                                                                                                                                             US-09-940-235-12 (1-2096) x AAW94664
                                                                                                                                                                                                                                                                         The present invention describes a mutant streptokinase (SK) polypeptide in which at least one of the amino acids in the Pro58-Lys59-Ser60-Lys61 segment of the corresponding native SK is replaced by another amino acid. The present sequence represents native SK. SK is a secretory protein of haemolytic Streptococcus able to activate human plasminogen (HPlg) to plasmin (HPlm), which is a serine protease able to catalyse the hydrolysis of fibrin in blood clots. The SK is useful as a thrombolytic agent in the treatment of vascular thromboembolytic symptoms such as acute myocardial infarction. Compared with wild-type SK, the K59E mutant is more resistant to degradation by human plasmin and is more effective both in acting as a fibrolytic agent and in activating human plasminogen. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                            Mutant streptokinase polypeptide - thrombolytic agent.

                                                                                                                                                                                                                                                                                      The present sequence represents a native streptokinase. The specification describes a polypeptide which binds to a streptokinase specific antibody and prevents the antibody binding to native streptokinase. The specification also describes a synthetic polypeptide (P1) comprising an epitope which binds to an streptokinase-specific antibody and reduces thrombolytic activity of streptokinase-specific antibody and reduces therapy, and to prevent or treat glomerulonephritis and rheumatic fever. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                      Sequence 414

The hybrid PA possesses the C ability to bind with fibrin independently and also characteristically C retains a PG activation ability which becomes evident only after a C pronounced duration, or lag, after exposure of the PA to a suitable C animal or human PG. The hybrid streptokinase-fibrin binding domain C polypeptides are useful in thrombolytic therapy for various kinds of C cardiovascular disorders. The hybrids have enhanced fibrin selectivity as C well as kinetics of plasminogen activation that are distinct from that of natural streptokinase in being characterised by a temporary delay, or lag of several minutes in the natural rate of the catalytic conversion of C plasminogen to plasmin (i.e. delayed-action thrombolysis). The proteins C can bind tightly with fibrin in blood clots soon after introduction into the vascular system without significantly activating the circulating C blood plasminogen to plasmin, thus aidling in the localisation of the C plasminogen activation process to the site of pathological thrombus. This overcomes systemic plasminogen activation encountered during clinical use of streptokinase. (Updated on 12-SEP-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a mutant streptokinase (SK) polypeptide in which at least one of the amino acids in the ProSB-Lys59-Ser60-Lys61 segment of the corresponding native SK is replaced by another amino acid. The present sequence is mutant SK K59E. SK is a secretory protein of haemolytic Streptococcus able to activate human plasminogen (HPlm), which is a serine protease able to catalyse the plasmin (HPlm), which is a serine protease able to catalyse the hydrolysis of fibrin in blood clots. The SK is useful as a thrombolytic agent in the treatment of vascular thromboembolytic symptoms such as acute myocardial infarction. Compared with wild-type SK, the K59E mutant is more resistant to degradation by human plasmin and is more effective both in acting as a fibrolytic agent and in activating human plasminogen

The sequence of the synthetic hirudin HV-1 genes was designed based on the published amino acid sequence (Dodt J., et al FEBS Letters 165 180 (1984)). The sequence of streptokinase was obtd. from PCR amplified chromosomal DNA from S. equisimilis ATCC 10009 or ATCC 9642. The primers used for the PCR were based on the pub- lished DNA sequence of S. equisimilis strain H46A (Malke, H., Roe, B., and Ferretti, J.J., Gene 34 357-362 [1985]). The two sequences were used to construct an expression vector in which the streptokinase gene is linked to the hirudin gene via a linking sequence encoding a cleavage site for factor Xa. The factor Xa is present at the site of the target thrombus so the active agents are released specifically at the place where clot formation is occurring.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
This sequence represents a fusion protein between maltose-binding protein and the plasminogen-binding fragment of streptokinase. This fusion protein was used in the design of modified streptokinase has an in vitro degradation rate at least 2 times slower than that of native streptokinase. Compounds containing modified streptokinases are specifically used as thrombolytic agents for dissolving blood clots in vivo in a mammal, preferably at a dose of 20000 U/kg, optionally as a bolus rather than by continuous infusion. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                     Example 1;

17-SEP-1991
The streptokinase sequence was obtd. from PCR amplified chromosomal DNA from S. equisimilis (Lancefield's Gp C) ATCC 10009 or ATCC 9642 (the primers used for the PCR were based on the published DNA sequence of S. equisimilis strain H46A (Malke, H., Roe, B., and Ferretti, J.J., Gene 34 357-362 [1985]). The gene was fused to DNA encoding the yeast alpha factor pre-pro-secretion sequence in an expression vector, pSMD1/152, fc prodn. of recombinant strepto- kinase in S. cerevisiae strain BJ2168. Se

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Вb
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ঠ
                                                                                      This sequence represents the wild type plasminogen-binding fragment of streptokinase. This fragment was used in the design of a modified streptokinase has an in vitro degradation rate at least 2 times slower than that of native streptokinase. Compounds containing modified streptokinases are specifically used as thrombolytic agents for dissolving blood clots in vivo in a mammal, preferably at a dose of 20000 U/kg, opt. as a bolus rather than by continuous infusion. ; Sequence 43, Application US/07854596B
; Patent No. 5434073
; GENERAL INFORMATION:
APPLICANT: Dawson, Keith M
; APPLICANT: Hunter, Michael G
; APPLICANT: Czaplewski, Lloyd G
TITLE OF INVENTION: Proteins and nu
NUMBER OF SEQUENCES: 73
                                                                                                                                        ; LENGTH: 483 amino acids
; TYPE: amino acid
; TOPOLOGY: linear
; MOLECULE TYPE: protein

; Publication No. US20040009550A1
; GENERAL INFORMATION:
APPLICANT: Moll, Gert N.
APPLICANT: Moll, Gert N.
TITLE OF INVENTION. Export and modification of (poly) peptide in the lantibiotic way
FILE REFERENCE: 2183-5673
CURRENT PHILING DATE: 2003-02-07
PRIOR APPLICATION NUMBER: EP 02077060.8
PRIOR FILING DATE: 2003-05-24
NUMBER OF SEQ ID NOS: 309
SOFTWARE: Patentin version 3.1
SEQ ID NO 264
LENGTH: 413
TYPE: PRT
ORGANISM: Artificial Sequence
FEATURE:
OTHER IMFORMATION: sequence of streptokinase
